Abstract

Background: The World Health Organization recommends a maximum daily salt intake of 5 g for adults; the Islamic Republic of Iran has national standards for salt content of foods.

Aims: This study aimed to determine the salt content of industrial (made in large-scale food companies) and non-industrial (made in local stores using traditional methods) foods in Tehran province and compare it with the Iranian national standards.

Methods: We determined the salt content of 555 industrial and non-industrial products from parts of Tehran province in 2016 and 2018. The types of foods examined were: canned vegetables, industrial and non-industrial pickled vegetables, industrial and non-industrial tomato paste/tomato sauce, industrial and non-industrial nuts, and non-industrial barberry juice. The salt content of each product and its compliance with Iranian national standards was evaluated.

Results: The salt content of industrial tomato paste/sauce in 2016 (2.05 g/100 g) and non-industrial tomato paste/sauce in 2018 (2.37 g/100 g) was higher than the Iranian standard (1.5/2.0 g/100 g). The mean salt content of both industrial (1.97 g/100 g) and non-industrial (2.16 g/100 g) nuts was higher than the Iranian standard (1.88 g/100 g), as was the mean salt content of non-industrial juice (0.79 g/100 mL versus 0.25 g/100 mL). In 2018, only 48% and 40% of industrial and non-industrial tomato pastes/sauces met the Iranian standard. Overall, industrial products conformed better with the national standard than non-industrial products.

Conclusions: Efforts are needed to reduce the salt content of processed food in the Islamic Republic of Iran and ensure they meet the Iranian standards.

Keywords: salt, dietary sodium chloride, food products, Iran.

Introduction

According to the scientific literature, one of the main factors that causes chronic noncommunicable diseases (such as cardiovascular disease) is the excessive use of processed food. Production and processing of these types of foods have spread around the world (1). Salt (sodium chloride) is a component of processed food and excessive consumption of these foods results in a high intake of salt. According to extensive research, there is a direct relationship between salt consumption and blood pressure (2), and a reduction in daily salt intake of 4.4 g can result in lower blood pressure (3). High blood pressure is one of the main factors associated with death in adults globally. Furthermore, the risk of cardiovascular diseases increases in parallel with increases in blood pressure. In addition to its effect on blood pressure, salt can lead to other health conditions, such as kidney stones, urinary calcium excretion, disorders of bone metabolism, gastric cancer, cataracts and asthma (2,4). According to the World Health Organization (WHO) in 2018, in order to improve public health, the maximum recommended daily salt intake is 5 g for adults (5). Salt is a natural component of many foods such as milk, cream and eggs, but processed products, including bread, processed meat (e.g. sausages), nuts, canned and pickled products, and fermented dairy products, contain a higher concentration of salt (6). While salt poses health risks, this compound is also a vital element in biological activity and food processing, including regulating the osmotic pressure of a living cell and producing palatable food. Salt is a food preservative which increases food safety by reducing the water activity of a food. Salt also intensifies the taste and aroma of food and can enhance textural properties, alter the consistency of the food and influence food appearance and feel. Given these effects of salt on food, reducing the amount of salt in processed food can reduce food acceptability (6).

The salt consumption of Iranians is much higher than the WHO recommended amount (7). Many Iranians do not know about the health hazards of salt and the...
safe amount to consume daily, and do not have any knowledge about how much salt enters the body through consumption of processed food. Therefore, monitoring the salt content of foods that are distributed in the supermarkets is one way that can raise the awareness of society and improve public health (8). In this regard, the Iranian Ministry of Health and Medical Education established a national committee to oversee decisions and activities to monitor and reduce factors that increase the risk of noncommunicable diseases in the country and to develop new regulations in line with WHO recommendations.

Therefore, this study aimed to determine the salt content of the most commonly consumed processed foods in the Islamic Republic of Iran and evaluate the compliance of each food group with the national salt standards (9–11).

Methods
We assessed the salt content of 555 types of processed food available in Tehran province in 2016 and 2018. We categorized food products into eight groups: non-industrial fruit juices (28 products), industrial tomato paste and sauce (54 products), non-industrial tomato paste and sauce (21 products), canned vegetables (76 products), industrial pickles (88 products), non-industrial pickles (112 products), industrial processed nuts (56 products) and non-industrial processed nuts (120 products). Industrial products are those made in large-scale food companies and non-industrial products are those made in local stores using traditional methods.

The salt content of these products was evaluated according to the national standard of the Islamic Republic of Iran (9,12).

An ANOVA (with Duncan post hoc, repeated measures, 2018) was used to determine significant differences between each food group produced in 2016 and 2018 and to determine significant differences with the Iranian national standard.

Results
According to the Iranian national standard for canned vegetables, the permitted level of salt is 1.5–2.0 g/100 g (9). The mean salt content of industrial canned vegetables was 1.1 g/100 g and 1.2 g/100 g in 2016 and 2018, respectively. In 2016, all of the samples of industrial canned vegetables complied with the Iranian national standard, while about 4% of them contained more than the standard level in 2018 (Figure 1). Based on the serving size of canned foods (125 g), the average daily per capita intake of salt and sodium is 1.5 g and 585 mg, respectively (Table 1). The statistical results presented in Table 2 show that the mean salt content of canned vegetable in 2016 and 2018 were statistically different.

The mean salt content of industrial pickles complied with the Iranian national standard in 2016, but in 2018, about 4% of industrial pickles did not (Figure 1). Based on the serving size of industrial pickles (50 g), the average...
per capita intake of salt and sodium was 1.2 g and 468 mg, respectively (Table 1).

The compliance with the Iranian national standards for salt content of industrial tomato paste was 83% and 48% in 2016 and 2018, respectively (Figure 1). There were no significant differences between the salt content of tomato paste and sauce in 2016 and 2018 (Table 2). The standard compliance rate of non-industrial tomato sauces was 40% in 2018, which was lower than the industrial products (Figure 1).

With regard to nuts, industrial salted sunflower seeds had the highest mean salt content of nuts while industrial salted pistachios and roasted pistachios had the lowest. However, one brand of industrial pumpkin seed had the lowest salt content, while another brand of pumpkin seed had the highest salt content. As regards non-industrial nuts and seeds, the salt content of some samples was more than the standard allowable value in 2016, including pumpkin seeds, Japanese seeds and cashew nuts. In 2018, the salt content of pumpkin seeds, Japanese seeds, sunflower seeds and watermelon seeds was more than the permitted level. The compliance of non-industrial nuts with the Iranian national standard was 88% and 72% in 2016 and 2018, respectively.

There is no determined standard for salt content of pomegranate juice, blueberry juice, blackberry, sour cherry juice and plum juice; however, the evaluation of the salt content of barberry juice showed that it was more than permitted value, especially in 2018.

Discussion

Our findings show that non-industrial products had a lower rate of compliance with the Iranian standards. Thus, non-industrial products are more likely to be harmful to sensitive and vulnerable people such as elderly people, children and people with high blood pressure and cardiovascular disease. The Islamic Republic of Iran is a large country with a variety of cultures and dietary behaviours. Our study determined that some food formulation should be revised to improve public health in the country. Moreover, as sodium imposes health risks, determining the sodium content of food products should be a regulation in food industries. In the Islamic Republic of Iran, salt levels in non-industrial processed foods are much higher than in industrial processed foods, which suggests that people should be encouraged to consume industrial food products.

An unhealthy diet is one of the risk factors that can influence the public health of a country (6). Diet has more effect on the health of people of all ages than other factors including physical inactivity, excessive use of

*Iranian national salt targets (9–12).

No significant differences were found between the 2016 and 2018 salt levels for any of the food products (P > 0.05).
Teneur en sel des aliments transformés en République islamique d'Iran et respect des normes relatives au sel

Résumé

Contexte : L'Organisation mondiale de la Santé recommande un apport quotidien maximal en sel de 5 g pour les adultes, et la République islamique d'Iran a établi des normes nationales pour la teneur en sel des aliments.

Objectifs : La présente étude visait à déterminer la teneur en sel des aliments industriels (fabriqués par de grandes entreprises alimentaires) et des aliments artisanaux (fabriqués dans des magasins locaux selon des méthodes traditionnelles) dans la province de Téhéran et à la comparer aux normes nationales iraniennes.

Acknowledgement

We thank the Iranian Food and Drug Administration, Shahid Beheshti University of Medical Sciences, and National Nutrition and Food Technology Research Institute.

Funding: None.

Competing interests: None declared.
Résultats : La teneur en sel des coulis de tomate/sauce tomate industriels en 2016 (2,05 g/100 g), coulis de tomate/sauce tomate artisanaux en 2018 (2,37 g/100 g) était supérieure à la norme iranienne (1,5-2,0 g/100 g). La teneur moyenne en sel des noix industrielles (1,97 g/100 g) et noix artisanales (2,16 g/100 g) était supérieure à la norme iranienne (1,88 g/100 g), tout comme la teneur moyenne en sel du jus artisanal (0,79 g/100 ml contre 0,25 g/100 ml). En 2018, seulement 48 % et 40 % des coulis/sauce tomate industriels et artisanaux étaient conformes à la norme iranienne. Dans l'ensemble, les produits industriels répondaient mieux à la norme nationale que les produits artisanaux.

Conclusions : Des efforts sont nécessaires pour réduire la teneur en sel des aliments transformés en République islamique d'Iran et s'assurer qu'ils sont conformes aux normes iraniennes.

احتواء الملح في الأغذية المصغّرة في جمهورية إيران الإسلامية، والامتثال لمعايير الملح

فاطمة زنديپویی، سارا سوهرا بوندی، ایلام خانی‌ری، بارنجه نیک‌رما، روزیتا فاندی، کیانوش خسروی، امیر مرتضایی‌فانان، محمد جولیان، نسیم خورشیدیان

الخلاصة

توضیح: ما قدرت منظمة الصحة العالمية بالتأكيد بناءً الحد الأقصى من نمط الملح 5 جرامات للبالغين يوميًا، ويتضمن جمهورية إیران الإسلامية معايير وطنية لحالتية للملح في الأغذية. الأهداف: هدف هذه الدراسة إلى تحديد محتوى الملح في الأغذية المصغّرة والاغذية المصغّرة التي تنتجها النقابات المهنية في محافظة طهران، ومقارنته بالمعايير الوطنية الإيرانية. طرق البحث: حددنا محتوى الملح في 555 منتجًا صناعيًا ونفريًا من أنحاء مختلفة في محافظة طهران، وشملت أنواع الأغذية التي تم فحصها: الخضروات المخللة، الخضروات المعلبة، ومعجون/صلصة الطماطم الصناعية، ومكسرات الصناعية، والخضروات المصنعة وغير الصناعية، وعصير البرباري الصناعي. النتائج: كان مستويات محتوى الملح لكل منتج هو: الخضروات المصنعة (1.1/1.2%)، والخضروات الصناعية (2.4/2.5%)، والمحصولات الصناعية (2.3/2.4%)، ومعجون/صلصة الطماطم الصناعية (2.5/2.6%)، ومعجون/صلصة الطماطم الذي تنتجها النقابات المهنية (2.1/2.2%)، والخضروات الصناعية (1.1/1.5%)، والمكسرات التي تنتجها النقابات المهنية (1.1/1.2%)، والعصير الذي تنتجها النقابات المهنية (0.8/0.9%)، والخضروات الصناعية (1.1/1.2) وتعتبر المعايير الوطنية عبارة عن أقصى من النظم المختلفة، وكانت النتائج الفردية على التوالي. وفي سياق المنتجات الصناعية مع المعايير الوطنية بصورة أفضل من المنتجات النقابية. الاستنتاجات: يلزم بذل جهود للحد من محتوى الملح في الأغذية المصغّرة في جمهورية إیران الإسلامية وضمان استيفائها للمعايير الإيرانية.
