Key Words
Female sexual dysfunction · Diabetes mellitus

Abstract
Objective: This study was designed to assess sexual dysfunction in women suffering from type 2 diabetes mellitus. Subjects and Methods: Forty-five type 2 diabetic, non-menopausal married women, aged 20–55 years, who were referred to Shahid Labbafinejad Clinics from March 2008 to June 2009 were included in this study. They were compared to 91 non-diabetic volunteers. Sexual function was evaluated by the sexual function questionnaire. Genitourinary examination was performed in all subjects. Blood sample tests were requested for fasting blood sugar, hemoglobin A1c, 2-hour postprandial glucose and lipid profile measurements. Ophthalmologic and neurologic examinations (checking deep tendon reflexes) were done for cases. Results: The mean age of cases and controls was 42.17 ± 5.91 and 34.96 ± 8.30 years, respectively (p < 0.001). The prevalence of a high probability of female sexual dysfunction in 6 domains including desire, arousal sensation, arousal lubrication, orgasm, pain and enjoyment was 71.1, 84.4, 55.6, 71.1, 8.9 and 66.7% in the diabetes mellitus women and 56.6, 67.0, 59.3, 57.1, 25.3 and 53.8% in the non-diabetic volunteers, respectively. Differences were statistically significant in the 3 domains of desire, arousal sensation and pain (p < 0.05). Deep tendon reflexes were normal in all and 12.5% showed diabetic retinopathy. Conclusions: Sexual dysfunction in cases as well as in controls was high; however, further studies with a higher number of patients are needed to confirm the results.

Introduction

Diabetes mellitus is a common disease that may impair sexual activity in men and women. According to the American Diabetes Association, 20.8 million (7%) of Americans have been diagnosed with diabetes mellitus [1]. In men, diabetes mellitus has long been recognized as a major risk factor for impaired sexual function as 20 to >70% of diabetes mellitus men suffer from sexual dysfunction that include primary erectile dysfunction, pre-ejaculation, orgasm and desire [2–4]. Female sexual dysfunction is a highly prevalent health problem affecting 25–63% of women [5–7]; the prevalence of female sexual dysfunction and the associated risk factors are less clear than in men [8].
female sexual dysfunction vary greatly depending on the definition, the assessment tool used and population demographics (education, marital status, age and race) [9].

In this study, we evaluated female sexual dysfunction in type 2 diabetic mellitus non-menopausal women in comparison with non-diabetic volunteers with the same age range.

**Subjects and Methods**

Our study was approved by the Ethics Committee of Shahid Beheshti University of Medical Sciences.

Forty-five type 2 diabetic mellitus, non-menopausal married women, aged 20–55 years, were included in this study from March 2008 to June 2009 at the Shahid Labbafinejad Medical Center. The control group included 91 non-diabetic, married volunteers with the same age range. An internal medicine specialist and endocrinologist (R.G.K.) confirmed the type of diabetes mellitus. Exclusion criteria were: married women who lived apart from their spouses; history of major diseases such as neoplasm, heart failure or end organ damage such as chronic renal failure; history of sexual abuse, major depression, or history of regular use of antidepressants or anxiolytics, as well as signs of severe organ prolapse such as uterine prolapse, cystocele stage ≥3 or signs of perineal iatrogenic severe scars (due to previous surgeries) which prohibited effective entrance. At the first visit, patients and controls got a code number. A general physician filled in the demographic questionnaire for all participants. Both groups filled in the sexual function questionnaire (SFQ) by themselves with or without the aid of an assistant (Appendix).

The SFQ contained 31 questions evaluating sexual function in 6 domains: desire, arousal sensation, arousal lubrication, orgasm, pain, and enjoyment. All subjects obtained a score for each domain. According to their scores, women were categorized into three groups: high probability for sexual dysfunction, borderline probability for normal sexual function, and high probability for normal sexual function (Appendix).

Venous blood samples were withdrawn for fasting blood sugar, glycosylated hemoglobin A1c, 2-hour postprandial glucose test and lipid profile (cholesterol, triglyceride, low-density lipoprotein, high-density lipoprotein) measurements in both groups. Genitourinary examination was performed in mid-cycle at lithotomy position by an experienced female urologist (F.S.), and the patient was evaluated for evidence of pelvic organ prolapse based on pelvic organ prolapse quantification [10] or any severe perineal iatrogenic scars. To evaluate the effect of diabetes on sensory motor response, a monofilament test and deep tendon reflexes were carried out in all diabetic cases. All diabetic patients were referred to an experienced ophthalmologist to test for signs of retinopathy.

Data were evaluated using SPSS 16 software. Data are reported as the mean and standard deviation for continuous variables and frequency and relative frequency for categorical variables. Groups were compared using the t and χ² test; for multivariate analysis, ANCOVA was used. The statistically significant level was set at p < 0.05.

**Results**

The age range of both the case and the control group (20–55 years) was 42.1 ± 5.9 and 34.9 ± 8.3 years, respectively, and the difference was statistically significant (p < 0.001).

The characteristics of the case and control groups are shown in table 1. The mean body mass index of diabetics and controls was 29.2 ± 5.9 and 26.4 ± 4.2, respectively (p < 0.001). The mean duration of diabetes mellitus in the case group was 6.35 ± 5.41 years.

Only 2 (4.4%) patients had reduced results in the monofilament test. Deep tendon reflex tests were normal in all cases. The characteristics of diabetes mellitus patients are shown in table 2.

Thirty-four (75.6%) and 55 (61.1%) subjects of the control group had a history of genitourinary and colorectal surgery. Twenty-four (53.3%) cases showed results of ophthalmologic examination; 3 (12.5%) had diabetic retinopathy.

The mean serum level of fasting blood sugar for cases and controls was 162.83 versus 89.11 mg/dl, and for tri-
glyceride, 176.44 and 126.69 mg/dl (table 3), respectively. There was a statistically significant difference between cases and controls.

Of the 45 cases and 91 controls, 32 (71%) and 51 (56%) suffered from dysfunction in sexual desire, respectively (p = 0.009; table 4; Appendix). Thirty-eight (84%) cases and 61 (67%) controls suffered from arousal sensation problems; the difference was statistically significant (p = 0.027). Also, 4 (8.9%) cases and 23 (25.3%) controls had pain disorders. There was no significant relationship between sexual function, body mass index, job, smoking, and glycemic control.

**Discussion**

In our study, the domains of desire and arousal sensation were more adversely affected in the cases than in the control group (p < 0.05), as previously reported [11, 12]. The World Health Organization recognized the importance of human sexuality as part of an individual’s health and well being in 1974 [13]. Several factors contribute to sexual activity in women such as sexual education, economic status and relationship with partner, family issues, depression and others. The high rate of desire and arousal sensation dysfunction in our study may be related to the higher mean age, higher body mass index, vascular disorders and the negative effect of a chronic disease on mood. Pain was more frequent in the control than in the case group which could be due to a better sensation, compared to diabetics.

Loss of vaginal lubrication, reduced sensation and sexual pleasure in women with type 2 diabetes as observed in this study is similar to that reported by Meeking et al.
[14] in type 1 and type 2 diabetic women. Similar observations have been reported by Fatemi and Taghavi [15] in type 2 diabetic women. In the investigation of Schreiner-Engel et al. [16] of cognitive, psychological, interpersonal, and sexual dimensions with diabetes, diabetic women showed a relatively low impairment in sexual responses, but sexual desire was significantly lower. The observations could be attributed to the changes in life style, psychological state, neurologic and vascular deficits during a chronic disease such as diabetes.

Pain disorders of 8.9% in our study was lower than the 26% reported by Safarinejad [17] in a population-based study of 2,626 women, aged 20–29 years. Probably, the wider age range of 20–55 years in our study could explain the difference between the two studies.

In conclusion, prevalence of sexual dysfunction in diabetic mellitus women and controls was high; however, as the number of cases was limited, further studies with a higher number of patients are needed to confirm the results.

Acknowledgement
The authors wish to acknowledge Prof. M. Baradaran for his technical assistance in the ophthalmologic examination of patients.

Appendix: The Female SFQ

The SFQ contains 31 items and each item has 5 or 7 possible response options

Items 1–5, 25, 26 and 31 were scored 1–5 (in ascending order), e.g.,
1. Over the last 4 weeks, how often have you had pleasurable thoughts and feelings about sexual activity?
   1. Not at all
   2. Rarely
   3. Sometimes
   4. Often
   5. Very often

Items 6–12, 14, 18, 19 and 21–24 were scored 1–5 (in ascending order) with the ‘not applicable’ category (e.g., ‘I did not take part in sexual activity’, ‘I did not have any orgasms’) set to ‘missing’, e.g.,
6. Over the last 4 weeks, in general, how enjoyable has it been to be sensually touched and caressed by your partner?
   1. Not enjoyable
   2. Slightly enjoyable
   3. Moderately enjoyable
   4. Very enjoyable
   5. Extremely enjoyable

Items 13 and 17 were scored 0–6 (in ascending order), e.g.,
13. Over the last 4 weeks, how often did you take part in sexual activity with penetration (e.g., vaginal penetration and intercourse)?
   0. I did not take part in sexual activity
   1. Once/twice
   2. 3–4 times
   3. 5–8 times
   4. 9–12 times
   5. 13–16 times
   6. >16 times

Items 15, 16, 27, 28 and 29 were scored 1–5 (in descending order; for items 15, 16 and 27, the ‘I did not take part in sexual activity’ category is set to ‘missing’), e.g.,

28. Thinking about the last 4 weeks, how much did you worry that your partner may look for another sexual relationship because of problems with your sexual life?
   5. Not at all
   4. Slightly
   3. Moderately
   2. Very
   1. Extremely

Item 20 is scored from 5–1 with the ‘I did not take part in sexual activity’ scored as ‘missing’ and the ‘I did not take part in sexual activity because of being worried or anxious about pain’ scored as 0, i.e.
20. Over the last 4 weeks, how often have you been worried or anxious about pain during sexual activity?
   1. I did not take part in sexual activity (missing)
   0. I did not take part in sexual activity because of being worried or anxious about pain
   5. Not at all
   4. Sometimes
   3. Often
   2. Very often
   1. Every time

Note: item 30 was not included in the overall scoring but may be tabulated if desired.

Total score: A total score may be derived from summing the individual item scores, except item 32. The total score range is 30–167. A higher score indicates better sexual function.

S = Sensation; L = lubrication. Scores indicating a high likelihood of normal function have been derived using discriminant analyses from the current database and should be used as guidelines only. There is a band of scores below these where functional status (excluding partner domain) would be considered as borderline depending on other clinical indices. See table for SFQ score ranges indicative of the likelihood of female sexual dysfunction.
Sexual life includes both the physical sexual activities and the emotional sex-
ual relationship that you have with your partner. When used in conjunction with a clinical sexual history interview, the SFQ scores should be supportive of information derived from the subject (i.e. if the subject proposes that orgasm is her greatest sexual complaint, a score within the range of 3–11 would be expected. A score >12 should prompt a review and further discussion).

S = Sensation; L = lubrication.

Where discrepancies between the SFQ score and the sexual problem(s) derived from the sexual history interview arise, the opportunity should be taken to discuss this further with the subject and determine the cause(s) for any discrepancy.

These questions ask about your sexual activity over the last 4 weeks. Please answer every question by marking one box with a cross. If you are unsure about how to answer, please give the best answer you can. In answering these questions the following definitions apply: Sexual activity includes any activity which may result in sexual stimulation or sexual pleasure, e.g., intercourse, caressing, foreplay, masturbation (i.e. self-masturbation or your partner masturbating you) and oral sex (i.e. your partner giving you oral sex). Sexual life includes both the physical sexual activities and the emotional sexual relationship that you have with your partner.

1. Over the last 4 weeks, how often have you had pleasurable thoughts and feelings about sexual activity? Answer selection: Not at all; Rarely; Sometimes; Often; Very often.
2. Over the last 4 weeks, how often have you wanted to be sensually touched and caressed by your partner? Answer selection: Not at all; Rarely; Sometimes; Often; Very often.
3. Over the last 4 weeks, how often have you wanted to take part in sexual activity? Answer selection: Not at all; Rarely; Sometimes; Often; Very often.
4. Over the last 4 weeks, how often have you initiated sexual activity with your partner? Answer selection: Not at all; Rarely; Sometimes; Often; Very often.
5. Over the last 4 weeks, how often have you been sensually touched and caressed by your partner? Answer selection: Not at all; Rarely; Sometimes; Often; Very often.
6. Over the last 4 weeks, in general, how enjoyable has it been to be sensually touched and caressed by your partner? Answer selection: I have not been touched or caressed; Not enjoyable; Slightly enjoyable; Moderately enjoyable; Very enjoyable; Extremely enjoyable.
7. Over the last 4 weeks, how often did you have a feeling of ‘warmth’ in your vagina/genital area when you took part in sexual activity? Answer selection: I did not take part in sexual activity; Not at all; Sometimes; Often; Very often; Every time.
8. Over the last 4 weeks, in general, how much ‘warmth’ did you feel in your vagina/genital area when you took part in sexual activity? Answer selection: I did not take part in sexual activity; None; Slightly ‘warm’; Moderately ‘warm’; Very ‘warm’; Extremely ‘warm’.
9. Over the last 4 weeks, how often did you have a sensation of ‘pulsating’ (‘tingling’) in your vagina/genital area when you took part in sexual activity? Answer selection: I did not take part in sexual activity; Not at all; Sometimes; Often; Very often; Every time.
10. Over the last 4 weeks, in general, how much ‘pulsating’ (‘tingling’) in your vagina/genital area did you notice when you took part in sexual activity? Answer selection: I did not take part in sexual activity; No sensation; A mild sensation; A moderate sensation; A strong sensation; A very strong sensation.
11. Over the last 4 weeks, how often did you notice vaginal wetness/lubrication when you took part in sexual activity? Answer selection: I did not take part in sexual activity; Not at all; Sometimes; Often; Very often; Every time.
12. Over the last 4 weeks, in general, how much vaginal wetness/lubrication did you notice when you took part in sexual activity? Answer selection: I did not take part in sexual activity; No wetness/lubrication; Slightly wet/lubricated; Moderately wet/lubricated; Very wet/lubricated; Extremely wet/lubricated.
13. Over the last 4 weeks, how often did you take part in sexual activity with penetration (e.g., vaginal penetration and intercourse)? Answer selection: I did not take part in sexual activity; Once/twice; 3–4 times; 5–8 times; 9–12 times; 13–16 times; >16 times.
14. Over the last 4 weeks, in general, how much did you enjoy penetration and intercourse? Answer selection: I did not take part in sexual activity; Not enjoyable; Slightly enjoyable; Moderately enjoyable; Very enjoyable; Extremely enjoyable.
15. Over the last 4 weeks, how often did you experience pain in your vagina/genital area during or after sexual activity (e.g., penetration, intercourse)? Answer selection: I did not take part in sexual activity; Not at all; Sometimes; Often; Very often; Every time.
16. Over the last 4 weeks, in general, how much pain did you experience in your vagina/genital area during or after sexual activity (e.g., penetration, intercourse)? Answer selection: I did not take part in sexual activity; No pain; Slightly painful; Moderately painful; Very painful; Extremely painful.
17. Over the last 4 weeks, how often did you take part in sexual activity without penetration (e.g., masturbation and oral sex)? Answer selection: I did not take part in sexual activity; Once/twice; 3–4 times; 5–8 times; 9–12 times; 13–16 times; >16 times.
18. Over the last 4 weeks, in general, how much did you enjoy sexual activity without penetration (e.g., masturbation, oral sex)? Answer selection: I did not take part in sexual activity; No enjoyment; Slightly enjoyable; Moderately enjoyable; Very enjoyable; Extremely enjoyable.
19. Over the last 4 weeks, how often did you feel emotionally close to your partner when you took part in sexual activity? Answer selection: I did not take part in sexual activity; Not at all; Sometimes; Often; Very often; Every time.
20. Over the last 4 weeks, how often have you been worried or anxious about pain during sexual activity? Answer selection: I did not take part in sexual activity; Not at all; Sometimes; Often; Very often; Every time.
21. Over the last 4 weeks, did you feel good about yourself when you were sexually active? Answer selection: I did not take part in sexual activity; Not at all; Slightly; Moderately; Very; Extremely.
22. Over the last 4 weeks, how often did you have an orgasm when you took part in sexual activity (may be with or without a partner)? Answer selection: I did not take part in sexual activity; No orgasm; Slightly organ; Moderately organ; Very organ; Extremely organ.
23. Over the last 4 weeks, in general, how much would you rate your sexual activity because of being worried or anxious about pain? Answer selection: I did not take part in sexual activity; Not at all; Sometimes; Often; Very often; Every time.
24. Over the last 4 weeks, in general, how often did you take part in sexual activity? Answer selection: I did not take part in sexual activity; Not at all; Sometimes; Often; Very often; Every time.
25. Over the last 4 weeks, how confident have you felt about yourself as a sexual partner? Answer selection: I did not take part in sexual activity; Not at all; Slightly; Moderately; Very; Extremely.

Sharifiaghdas/Azadvari/Shakhssalim/ Roohi-Gilani/Rezaei-Hemami

26. Thinking about your sexual life over the last 4 weeks, how often did you look forward to sexual activity? Answer selection: Not at all; Rarely; Sometimes; Often; Very often.

27. Thinking about your sexual life over the last 4 weeks, did you feel disappointed with your sexual response (e.g., ability to become aroused, lubrication)? Answer selection: I did not take part in sexual activity; Not at all; Slightly; Moderately; Very; Extremely.

28. Thinking about the last 4 weeks, how much did you worry that your partner may look for another sexual relationship because of problems with your sexual life? Answer selection: Not at all; Slightly; Moderately; Very; Extremely.

29. Thinking about your sexual life over the last 4 weeks, how much did you worry about your partner’s negative feelings about your sexual life (e.g., partner feeling angry, hurt, rejected)? Answer selection: Not at all; Slightly; Moderately; Very; Extremely.

30. Thinking about your sexual life over the last 4 weeks, how did you feel about the frequency of your sexual activity? Answer selection: A lot less than you desired; A little less than you desired; About right for you; A little more than you desired; A lot more than you desired.

31. In general, how important is being able to have an enjoyable sexual life to you? Answer selection: Not at all; Slightly; Moderately; Very; Extremely.
